

README – SPL Compiler

David Walker – 19055252

You can run the SPL compiler as a standard Python script to be run in the Terminal. **Make sure that `sp1.py`, `main.py`, and the text file you wish to compile are in the same directory.** You can then merely run `main.py`, and it will prompt you on what to do from there on out. All output will be displayed in the Terminal. Furthermore, while I acknowledge this being tested as a black-box, should you find the time or curiosity, or should it fail to work correctly, please feel free to examine the code – I must admit that I'm quite proud of how it came out, and hope you'll appreciate the structure and readability I tried to give it.

A typical command line method of running this program on Linux would be:

```
python3 main.py
```
